"Our success in the wholesale building industry is part due to the Piggy Back®. This forklift has enabled CALPLY to achieve the highest service in the seven states of operation. The CALPLY and Princeton combination has proved that service is what really counts, notably. Labor saving is great with one truck driver/forklift operator. We look forward to the future with Princeton as a member of our service ability."

Drywall
Application Guide

"Power, Stability, Optional Double Reach or 4 Way Steering make the Piggy Back® the most versatile drywall delivery system available."

* Drywall package

The drywall package features load support arms

A delivery system that is beyond your expectations!

the concept

The Princeton Piggy Back® Delivery System is a proven method for drywall job site delivery. It has revolutionized customer service and delivery efficiency throughout the US drywall industry. Historically, materials were delivered to the edge of a site by a truck-mounted crane. The customer, or your stocking crew, then had to move the materials to where the work was being done. The truck-mounted forklift enables your driver to deliver materials wherever your customer or crew wants them – fast, safe over even the roughest ground. A Piggy Back also comes in handy for pickups or correcting misplacement of products on the job site. It will also save money by reducing delivery related product damage. Princeton's truck-mounted forklifts are available in many different models and can be

mounted behind almost any truck or trailer.

A wide range of available lift heights, capacities up to 6,500 lbs and other features allow the Princeton unit to be configured to your exact delivery requirements. Princeton offers a low profile unit designed for when there are height restricted deliveries.

If you currently use towed or trailer carried forklifts, you already recognize the benefits of having a portable unloading unit with your delivery vehicle. The Princeton Piggy Back Delivery System provides all these benefits in a highly efficient package that eliminates the complications of towed vehicles.

the machine

Princeton offers four models, tailored towards the demanding needs of the drywall industry.

PB50

The 5,000 lb capacity PB50 is the standard, heavy duty unit for the drywall industry. It's rugged design, center seating and optional double reach make it the most popular drywall model in the industry. It offers high horsepower, excellent ground clearance and a flip-of-the-switch traction control system to tackle the roughest job sites.

PB65

The 6,500 lb capacity PB65 is designed for those like to handle more product at the same time. Like the PB50, a drywall package is optional. This package features load support arms, that provide extra support for long drywall sheets when traveling through rough terrain. Both the PB50 and PB65 offer center seating. This provides your operator with a clear view of not only the load but also both front tires. This enables the operator to accurately position the load anywhere on the job site and minimize the chance of running over critical objects.

4 Way

The "4 Way" offers the most versatility available in truck mounted forklifts. It has the lift capacity and power of a PB50, but adds four directional steering. With the flip of a switch, this unit turns into a portable, side loading, rough terrain forklift. This combination enables your driver to deliver almost anywhere on the job site, even the tightest places. When delivering long loads on lots and driveways with trees or other obstacles, the Princeton 4 Way is the solution. A modified E series unit is available as a low profile alternative for restricted height deliveries.

All Princeton units exceed ANSI stability standards for rough terrain forklifts.

PBX

The PBX is the only unit in the industry equipped the S.O.L.O. feature (Single-side Off-Load Operation) which adds a scissors reach system to the standard moving mast and enables your driver to unload an entire truck or trailer from just one side – even at the axles.
